CONSULTATION LETTER

Date of letter: 14 October 2026

Patient:	Test Person	**Date of birth:**	14 March 1947 (fictional)
Referred by:	Dr Paul Garnier, General Practitioner	**Seen on:**	12 October 2026

Dear Dr Garnier,

Thank you for referring Test Person, who attended the Memory Clinic with a family member on 12 October 2026.

Reason for referral

Progressive difficulty over about two years with remembering recent events, repeating questions, and misplacing everyday objects. Their family reports that they sometimes become anxious in the late afternoon and evening.

Assessment

Mini-Mental State Examination 22/30. Montreal Cognitive Assessment 19/30, with the main losses in delayed recall and orientation to date. Mood screen: mild low mood, no thoughts of self-harm. Examination was otherwise unremarkable.

Investigations

MRI brain (30 September 2026): mild generalised atrophy with more marked hippocampal volume loss; no significant small-vessel disease and no space-occupying lesion. Blood tests (28 September 2026): vitamin B12, folate, thyroid function, calcium and kidney function all within normal limits.

SAMPLE · FICTIONAL

Impression

Findings are consistent with probable Alzheimer's disease, mild stage. I discussed this with the patient and their family, and explained that the treatment aims to support memory and daily function. It does not cure the condition.

Plan

1. Start donepezil 5 mg once a day, taken in the evening, for 4 weeks. If it is well tolerated, increase to donepezil 10 mg once a day in the evening. Common side effects include nausea, loose stools, vivid dreams and reduced appetite; please let us know if these are troublesome.

2. Continue vitamin D3 1000 IU once a day with a meal, as prescribed by the GP.

3. A family member should supervise medicines and keep a written list of what is taken and when.

4. Please avoid driving until the driving assessment has been completed.

5. Report any fall, new confusion, fainting, a very slow pulse, or repeated vomiting to the GP or the clinic the same day.

Follow-up

Review at the Memory Clinic on 14 January 2027 at 10:30, second floor, with Dr Fontaine. An occupational therapy home assessment will be arranged and the team will contact the family directly.

Yours sincerely,

Dr Claire Fontaine, Consultant Neurologist
Memory Clinic, Example University Hospital
